Hiring Manager
Example Payments

Application for Backend Engineer

Dear Hiring Manager,

I am applying for the Backend Engineer role at Example Payments. Example Payments process payments for 2,000 merchants in Southeast Asia.

At Example Fintech, I reduced p95 latency of the payment status API by 35% by adding a Redis cache in front of the reconciliation query. I also built REST endpoints for merchant refund requests with Spring Boot and PostgreSQL, covered by 40 integration tests using Testcontainers. Finally, I automated the nightly settlement report with a GitHub Actions workflow, saving the operations team about 3 hours a week.

Before that, as a Mechanical Design Engineer at Acme Precision Engineering, I wrote Python scripts to batch-process finite element simulation results, cutting post-processing time from 2 days to 3 hours per design iteration. Finally, I analysed vibration test data from 12 prototype units to identify a bracket resonance, leading to a redesign that passed qualification.

I would welcome the chance to discuss how this experience fits the Backend Engineer role. I am available from January 2027.

Yours sincerely,
Jordan Tan
